PROFILE

Systems Analysis and Development student at Fatec Jundiaí Ary Fossen. I build practical software spanning systems programming, full-stack web, and graphics: Rust services, React frontends, and C++/OpenGL rendering work. Drawn to understanding how software works under the hood, from rendering pipelines to the internals of the frameworks I build with.

CORE SKILLS

Systems: C, C++, Rust, OpenGL, CMake, Linux
Web: React, TypeScript, JavaScript, Node.js, Express
Databases: PostgreSQL, MySQL, MongoDB
Tools: Git, GitHub, Docker
Practices: Clean Architecture, TDD, RESTful API design

SELECTED PROJECTS

Anki My

React, Rust (Rocket), PostgreSQL, JWT

Jul 2025 - Present

- Full-stack spaced-repetition flashcard app: React frontend, Rust/Rocket backend, JWT-based authentication, PostgreSQL persistence.
- Backend handles spaced-repetition scheduling for card reviews, exposed to the frontend through the Rocket API.
- Consolidated frontend and backend into a single monorepo (git subtree) for unified versioning.

Pet Adoption System

PHP (vanilla), MySQL

May 2026

- Full-stack system for cataloging adoptable pets and managing adoption-interest submissions, built with vanilla PHP (no framework) and MySQL.
- Server-side form handling, validation, and data persistence implemented directly in PHP.
- Handles pet records (species, age, adoption status) with structured data entry directly through PHP forms.

First Game Engine

C++, OpenGL, GLFW, GLEW, GLM

Apr 2026 - Present

- Custom 3D engine built from scratch to study rendering pipelines and engine architecture.
- Implemented a first-person camera system with deltaTime-scaled rotation for frame-rate-independent movement.
- Uses vcpkg for dependency management and CMake + CPack for cross-platform builds.

EDUCATION

Fatec Jundiaí Ary Fossen

Systems Analysis and Development

Feb 2025 - Nov 2027 (expected)
